Create a simple React app use **Redux-saga** and use Star Wars API:
https://swapi.co/

The app should display a table containing a list of people:
https://swapi.co/api/people/
With the following Info:
Name, Height, Birth year

It should support **pagination** prev/next button so the user can navigation to prev/next page

Once a user clicks on the table row, the detailed box will show up and filled with more details info:
Name, Height, Birth year, Gender and **Names of the films** that person appeared

Here is a example layout:

Name	Height	Birth year

Detailed Box

Name:
Height:
Birth year:
Gender:
Films appeared:
- Film1
- Film2
- Film3
- …

My thinking:
For the detailed api call, first time a user clicked a row, it should get https://swapi.co/api/films/
And store the data.results.characters in store's state(cached) and when another person's row clicked. The react app can use the local data instead of making extra api calls.
